ITSE 1301 Web Design Tools

Final Project Development 4:

1. Review the guidelines for user-based and user-controlled navigation systems, and then specify the individual elements of a user-based and user-controlled navigation system for your website. I am going to use image links, and eye catching navigation tabs.
2. Using what you have learned about page layout and wireframing, create a sketch or blueprint of the layout of page elements.

3. Define your website's color scheme by using a web design template or color- matching software.

Colors with visual consistency from page to page, and also visually contrasting at the same time will be used. I am using a blue and purple color scheme.

4. Create a plan for testing, publishing, and maintaining your website.

Determine that all images display properly Make certain that no broken links exist Ensure all interactive elements such as forms are functioning properly. Check for spelling errors. Correct any identified problems Test site with several people who will click through everything Make sure there are no copyright issues. Test on several mobile devices – more and more people browse the web on mobile devices – phones, tablets, laptops. All files must be uploaded to a Web server – computer owned by hosting company – server provides an online address (URL) where your site resides. For maintenance, add changing, timely content. Check for broken links and add new links Document the last reviewed date on Web pages.
